

Lead Scoring Case Study – Subjective Questions Solutions

Q1. Which are the top three variables in your model which contribute most towards the probability of a lead getting converted?

Based on the Logistic Regression coefficients, the top three variables are:

1. Tags_Will revert after reading the email (Coefficient: 2.0056)
2. Tags_Closed by Horizzon (Coefficient: 1.7070)
3. Tags_Lost to EINS (Coefficient: 1.1662)

These variables have the strongest positive impact on lead conversion probability.

Q2. What are the top 3 categorical/dummy variables in the model which should be focused on the most to increase the probability of lead conversion?

The top categorical/dummy variables are:

1. Tags_Will revert after reading the email
2. Tags_Closed by Horizzon
3. Tags_Lost to EINS

Other important variables include Tags_Busy, Last Notable Activity_SMS Sent, and Lead Origin_Lead Add Form.

Recommendation: Prioritize leads with these tags and engagement indicators for follow-up.

Q3. Strategy during the intern hiring period

When additional interns are available, the company should lower the classification threshold (for example, from 0.50 to 0.30–0.35).

This increases Recall, allowing the model to identify more potential converters. The sales team can then contact a larger number of leads, reducing the chance of missing genuine prospects.

Business Reason: Missing a potential customer is more costly than making some extra calls.

Q4. Strategy when quarterly targets are already achieved

When the company wants to minimize unnecessary calls, it should increase the classification threshold (for example, from 0.50 to 0.70–0.80).

This increases Precision, ensuring that only highly probable leads are contacted.

Business Reason: The objective is to optimize sales effort and reduce unnecessary calls.

Conclusion

The Logistic Regression model successfully identifies high-potential leads. Variables related to lead tags, engagement behavior, and lead origin have the strongest influence on conversion probability. The model can help the sales team prioritize leads efficiently and improve overall conversion rates.
