

Lead Scoring Case Study

- Objective: Predict which leads are most likely to convert into customers using Machine Learning
- Predict high-potential leads and improve conversion rates.

Business Problem

- X Education receives many leads. The objective is to prioritize leads most likely to convert.

Analysis Approach

- Data Cleaning → EDA → Feature Engineering → Logistic Regression → Evaluation → Lead Scoring

Lead Conversion Distribution

Correlation Analysis

ROC Curve Performance

Key Findings

- • Tags_Will revert after reading the email is the strongest predictor
- • Tags_Closed by Horizzon and Tags_Lost to EINS are highly influential
- • Total Time Spent on Website positively impacts conversion

Business Recommendations

- • Prioritize high-score leads (>80)
- • Focus on highly engaged visitors
- • Use lead scores for sales allocation
- • Retrain the model periodically

Conclusion

- The model effectively identifies high-conversion leads and can improve sales efficiency.
